

RV RADIAL BLOWERS

Becker RV Radial Compressors are high flow, low pressure, centrifugal compressors. They are produced in single and two stage versions with flow rates of 589 and 1177 CFM, and pressure from 48" of water to 104" of water.

All RV blowers are direct-drive units - no belts are used - and there is never any oil in the discharge air because they are 100% Oil-less. Most units use a gear box to increase the rotational speed. A variable speed version is available.

For operating pressures to 204" of water, Becker [Regenerative Blowers](#) are available.
